Precision Agriculture

COMPONENTS OF PRECISION AGRICULTURE

Precision Ag Technology Today

- Basic PA technology is the Norm
 - ✓ Auto-Guidance is standard
 - ✓ Section and Rate Control on Planters and Sprayers
 - ✓ Variable-Rate Application of crop inputs
 - ✓ Yield Monitor on Harvest Equipment
- Growing with technology
 - Telematics, Data Management & **Drones**
 - Smart Sensors, Connected Technology & Imagery
- Future technology potential
 - Robotics & Automation
 - Machinery Learning & Artificial Intelligence

How do drones fit into Precision Agriculture?

- Yield maps provide spatial yield variability within the fields which helps in changing management to improve productivity and profitability across the whole field.
- Yield maps are “after-the-fact” and only help prepare for next year.
- To better manage crops, we need tools and technologies for detecting and addressing variability within the season.

How do drones fit into Precision Agriculture?

- Drones allow rapid deployment of high-resolution sensors to detect spatial (and address) variability that helps in improved in-season crop management.
- Timely detection of variability to develop real-time “actionable information”.

Drone Types – Rotary and Fixed Wing

Drone Sensors

Crop Scouting

- One of the most common application of drones in agriculture
- Manual scouting – limited to small parts of the field
- Drone scouting – provides a better perspective of what's happening across the whole field
- Mapping and logging features makes it a very effective scouting tool

Plant Stand Counts and Emergence

Plant Counting

High-resolution plant count maps developed using machine learning technology give our users early information on plant size by individual plant, row, plot or field. Identify planter skips and assess yield potential in early growth stages.

- + PLANT SIZE
- + LEAF AREA INDEX
- + PLANTER SKIPS
- + ROW STATISTICS
- + GROWTH STAGE
- + TILLER NUMBER

Crop Health Monitoring

- The second most used application of drones in agriculture today
- Relies on using a vegetative index to assess crop health such as NDVI or NDRE
- Enables delineation of areas/zones for site-specific management of crop inputs (e.g. variable-rate nitrogen)
- Major ag companies are integrating it into their farm data management software's.

Variable-Rate Nutrient Management

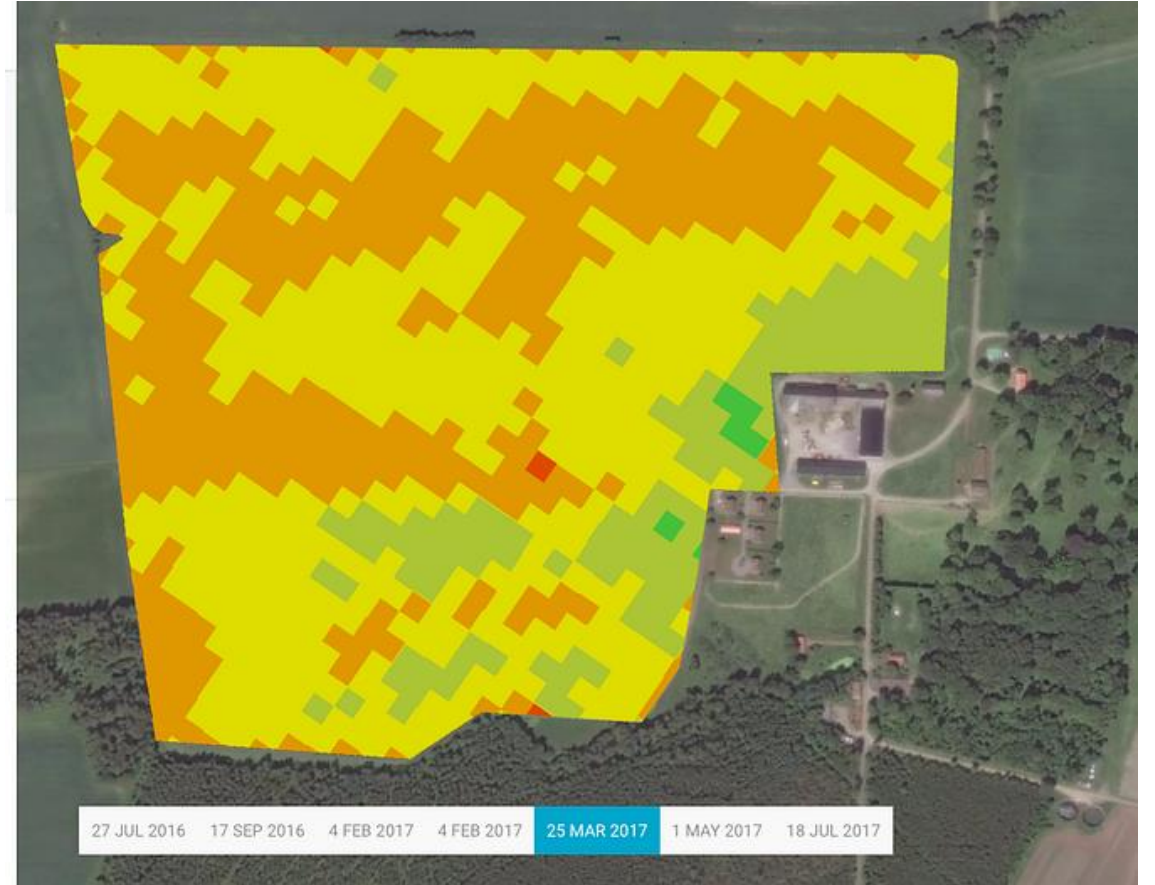

Irrigation Management

Blue: Wet soil
Red: Dry soil

Replant Decisions

VR Seeding using Drone Imagery

2022 image of soybeans, drought stress on soils with low water holding capacity

Soil Type boundaries for the same field. Green soils are Morrill glacial till. Purple and Red are Nodaway and Judson soils. Pink is Wymore.

Variable Seeding Rx using normalized yield data from 2013-2021 corn harvest data.

Weed Mapping and Prescriptive Spraying

Figure 2. A proprietary index, MicaSense Chlorophyll Index (MSCI), calculated from multispectral sensor imagery, depicting weeds (dark red) in a soybean field.

Drones and Field Research

Advanced Analytics for Agriculture

A validated, turnkey platform for agricultural research

Satellite Imagery
(30-300 cm/px)

Weather Data

Drone Flights
(0.1 - 10 cm/px)

Ground Data

aerial FLIGHT

dependable data delivery

aerial PLOT

automated analytics for agriculture

Aerial data collection & analytics:

- Validated standard operating procedures
- Standardized, state-of-the-art equipment
- Radiometric calibration
- Accurate data collection
- Streamlined data delivery
- Full growing season aerial data anything

Visualize & manage crop metrics

- Emergent vigor
- Plant health
- Canopy growth
- Plant height
- Stand counts
- Stress/Fertility response
- Senescence and maturity ratings

Application Drones

DJI Agras T30 Spray Drone

DJI Agras T10 Spreader System

Spray Drone Applications

- **Spot-spray herbicide applications** – where it is efficient and economical to treat with a drone sprayer.
- **Fungicide applications** – when a timely fungicide application with a ground sprayer or crop duster is not feasible.
- **Awkward acres or small fields** – fields or parts of the fields that makes applications with ground and/or crop duster challenging.

Spray Drones and VR Pesticide Applications

Spray Drones and Artificial Intelligence

 PRECISION AI

Drone Seeding

Cover Crop Management to Increase Soil Organic Carbon

Seeding standing cash crops with cover crops by heavy-lift seeder drones.

What's the future of drone technology & applications in precision agriculture?

- Sensor and mapping resolution will continue to increase with change in focus from **site-specific to by-plant management**.
- **Machine learning and artificial intelligence** integration will enable more (precision) applications of drones for in-season crop management.
- Change (ease of) in regulations will improve adoption and usage of **drones among growers** (specialized applications will still be offered as a service).
- Improvements in automation, battery life and hardware will enhance the capabilities for **real-time and data-driven applications** on the farms.

Thanks!
